

Study Number: 09081

Hepatitis B, Blood draw only study

Age: At least 18 years of age

Sex: Males and females

Health Status: Diagnosed with hepatitis B and on antiviral treatment

Height/Weight: No height/weight requirement

Stay: Two outpatient visits

You or your referral will receive up to \$50 for participation and completion of this study. In this study we are collecting blood samples from people who are diagnosed with hepatitis B and are currently on antiviral therapy. These samples will be used to determine the potential of stimulating immune cells from people with hepatitis B to produce interferon, a protein naturally produced by the body to fight viruses from multiplying.
